## Ejercicio 5:

Un circuito combinacional comparador toma dos números de 2 bits,  $\mathbf{A} = (A_1, A_0)$  y  $\mathbf{B} = (B_1, B_0)$  y retorna tres salidas (" $\mathbf{A} > \mathbf{B}$ ", " $\mathbf{A} = \mathbf{B}$ " y " $\mathbf{A} < \mathbf{B}$ ") de 1 bit cada una.

Ej: si A = (00) y B = (10), entonces "A>B" = '0', "A=B" = '0' y "A<B" = '1'.

- a. Construir la tabla de verdad para dicho sistema.
- b. Obtener la ecuación lógica como suma de minitérminos y producto de maxitérminos.
- c. Encontrar la función minimizada de cada salida como suma de productos usando mapas de Karnaugh.
- d. Implementar el sistema con compuertas lógicas básicas.
